GASKET

40FC SEALANT TUBES (x 3)
Clean the tank connection flange and ensure it is free of all grit etc. Check for flatness and deformation as this can cause the Chamber to become distorted or fail to seal. If in doubt contact our technical department + 44 (0)1756 799773

Remove protective cover from base of chamber and position chamber onto tank flange, aligning the holes.

Ensure the seal on the base of chamber is not damaged and is free from grit etc.

Fit a bolt and washer into each of the 28 holes (use only those supplied). Fit a washer and nut to each of the bolts. Tighten each bolt to 13.5Nm/10lbft torque, employing the following method, to avoid distortion of chamber.

Starting with any bolt tighten to 7Nm/5lbft torque. Move to the bolt positioned at 180° and tighten to 7Nm/5lbft torque. Move 180° plus one bolt pitch and tighten to 7Nm/5lbft of torque. Repeat until all bolts are tightened to 7Nm/5lbft torque.

Now repeat the procedure tightening all bolts to 13.5Nm/10lbft torque.

Note: The seal will initially relax and it is an advantage if each bolt is tighten to 13.5Nm/10lbft torque after a period of 24 to 48 hours after initial assembly.
INSTALLATION INSTRUCTIONS
(Pipework and Entry Seal Kits)

**Drill**
(150mm dia hole saw)

**Jigsaw**
+ Diamond tipped blades

**Gloves**

**Safety Goggles**

**Face Mask**

1. Position pipeway at 90° angles to the sump wall.
2. Ensure pipe entry boot is positioned away from the joints.

**NOTE:**
When backfilling ensure the pipework is not disturbed.

**WARNING:**
Do not backfill until the sump has been vacuum tested.

**Position pipeway at 90° angles to the sump wall.**

**Ensure pipe entry boot is positioned away from the joints.**

**WARNING**
Care must be taken to position the pipework and conduit so it exits the sump at 90° angle to the sump wall, otherwise undue stress will be placed on the sump wall and entry boot, which may lead to leaks in the future.

**Before installing pipework, fix a string line at ground level across the sump to check if material needs to be cut off the sump. If so, mark the sump with a line along the cut mark.**

Check to ensure you have the necessary minimum clearance required from the top of the sump to the centreline of the pipework/pipe entry kits.

**Standard Entry Kit = 145mm**
**Large Entry Kit = 170mm**

For shallow burials, it may be necessary to cut less material off the sump, and cut the remainder off the corbel and skirt to allow pipe entry boots to be fitted. **PLAN THIS CAREFULLY.**

Refer to measurement chart.

**Mark a centre point in the centre of a sump panel. Drill a pilot hole to ensure the hole saw can be positioned and used safely.**

**For larger holes (190mm) we recommend that the hole is marked and jigsaw is used to cut the hole. Drill a hole through the wall, so the jigsaw can be inserted and used easily and safely.**

(Fibreglass will blunt normal blades very quickly, we recommend diamond tipped blades or blades to cut ceramics).
The exit position of the pipework through the chamber wall must be as close as possible to 90°. The pipe kit should be fitted so that the pipework is centrally positioned to the seal. When backfilling ensure that the pipework is not disturbed from this central position.

NB: Where appropriate, it is recommended that a drill piloted hole saw be used to cut the pipe/cable seal entry hole in the chamber.

Angles of flexible entry sleeves must not exceed 12° from centre line (24° inclusive angle).

NB: Straps/clips are to be tightened in accordance with the pipe manufacturers recommendation.

The exit position of the pipework through the chamber wall must be as close as possible to 90°. The pipe kit should be fitted so that the pipework is centrally positioned to the seal. When backfilling ensure that the pipework is not disturbed from this central position.

INSTALLATION INSTRUCTIONS
( Conduit Entry Seal Kit Installation Guide )

PCE-1-KIT
Conduit must be installed at 90° angle to the side wall.

NB: Use the correct size drill piloted hole saw for each entry kit. The cable entry seal must be fitted perpendicular to the chamber wall and the conduit must enter the entry kit perfectly aligned. When backfilling ensure the conduit is not disturbed.
NB: Use the correct size drill piloted hole saw for each entry kit. The cable entry seal must be fitted perpendicular to the chamber wall and the conduit must enter the entry kit perfectly aligned. When backfilling ensure the conduit is not disturbed.

</table>
After penetrations have been fitted, ensure all connections on the manway lid are sealed.

Refer to Vacuum test instructions and perform a vacuum test.

Do not backfill around sump or cut material off the sump until the test has passed successfully.

**Note:** Sump to be tested to a depth setting of 1.2 meters/12 kPa.

Fix string lines 10mm above grade level across the sump lengths and widths of the tank farm to highlight any falls.

Place the corbel onto the sump (only ‘dry fit’ the corbel do not bond at this stage). Check the measurement from the top of the corbel to the string line, which is set 10mm above the general grade level. Check all sides of the sump and select the largest and smallest measurement to take account of falls across the forecourt.
### INSTALLATION INSTRUCTIONS

(Achieving the Correct Height)

#### Round Cover Systems

<table>

</thead>
<tbody>
<tr>
<td>Max. 297mm Min. 247mm</td>
<td>No trimming required, corbel can be bonded onto the sump. Adjust frame height using hangers.</td>
</tr>
<tr>
<td>less than 225mm</td>
<td>Trim material from chamber until clearance dimension falls within the range 297 to 247mm.</td>
</tr>
<tr>
<td>NB: The maximum amount of material that can be removed from the chamber is 515mm.</td>
<td></td>
</tr>
<tr>
<td>more than 297mm</td>
<td>The burial depth of the tank is greater than the maximum burial depth of the standard system. Bond a 300mm extension onto the sump. Then proceed as above.</td>
</tr>
</tbody>
</table>

---

See next page for extension bonding instructions
Abrade and wipe with a degreasing solvent the chamber top edge / wall and the extension recess shoulder.

To permanently fix the extension, invert the extension and apply a bead of adhesive sealant to the vertical wall of the extension recess.

Position the extensions(s) onto the sump, ensure the extension is horizontal and press down uniformly.

Apply a fillet of adhesive sealant (same nozzle size) to the external horizontal joint and smooth off.
16

Abrade and wipe with a degreasing solvent the sump or extension top edge/wall and the corbel groove.

17

Dry fit the corbel on the sump to ensure it fits - push corbel groove onto sump wall. If it does not fit, pipework may have distorted the sump wall shape.

18

Measure distance between opposite walls, this should be 1170mm. If less than this you will need to brace out the sump.

Using wooden batons (1170 ±5mm long) with timber spreader plates (150 x 150) to spread the load, brace out the sump to the correct size.

Repeat this process on all walls to get the correct shape.

19

Apply 2 tubes of Soudaflex 40FC sealant in the groove of the corbel. Sealant should fill 1/2 the groove.

20

Place the corbel on the sump using 2 people and push it into position.

21

Seal around the inside edge of the corbel joint from inside the sump. Smooth off the sealant with soapy water.

Use 1.5 tubes of 40FC sealant.

22

Seal around the outside joint and smooth off sealant with soapy water.

Use 1.5 tubes of 40FC sealant.
Wait a min of 12 hours before vac testing, preferably overnight to allow sealant to set before vacuum testing. Do not disturb the sump during this time.

Ensure all pipework and electrical entries have been completed before vacuum testing, this is a final test for all penetrations in the sump.

**Warning:** Test the corbel at a 0.6m depth setting only or irreparable damage may occur.

Refer to vacuum testing instructions for correct method.
Installation of Watertight Platforms:

Once the sumps are properly installed and tested, the watertight platforms should be installed to ensure that the platforms fit properly onto the stainless steel retaining rings.

25

Turn all T-handles on the top of the platform fully counterclockwise to the open position – the cam-lock latches on the underside should be 90 degrees opposed from the edge of the platform.

Cam-lock Latch in “Open” Position

26

Seat the watertight platform on the stainless steel ring. Turn the T-handles fully clockwise to lock the latch beneath the stainless steel ring (T-handle should be as shown).

When turning T-handle into locked position the cam-lock should compress very tightly. It may be necessary to adjust the cam-lock latch. See next page for instructions.

When it is confirmed that the platform seats correctly, removed it for final vacuum testing.

27
The T-handle mechanism consists of the above items.

Once the cam-lock is secure refit the watertight spill platform as per the steps on the previous page.

Note: It may be necessary to further adjust the cam-lock height until the optimal position is located.
Once the corbel test has been performed with a PASS result, the area around the sump can be carefully backfilled with peagravel or sand. Back-fill equally around the sump in layers to prevent damage or deformation.

( Adjusting the Skirt & Frame to Grade Level )

Fix a string line 10mm above grade level across the sump, fix 4 hangers on the corbel top with base support facing out.

Put the skirt and frame on the hangers.
Locate the 4 foam blocks supplied between the skirt and corbel turret to centralise the skirt about the corbel. Failure to do this may result in the platform fouling.

Adjust knobs to set the frame to stringline level, adjust for fall in grade. Set the frame 10mm above grade level.
**INSTALLATION INSTRUCTIONS (Concreting)**

**VERY IMPORTANT**

OUTER EDGE "A" OF FRAME SET 5 - 10MM ABOVE GENERAL FORECOURT AREA WITH CONCRETE RAMPED AWAY OVER 300MM.

---

**TYPICAL INSTALLATION**

**CONCRETE**

Minimum 200mm
Maximum 350mm

Complete backfilling to appropriate level. Frame must be supported by a minimum depth of 200mm of concrete. Concrete ties must be inserted as close to the frame as possible. Minimum block of 500mm square around the frame. Joint must be tied as per diagram. Continuous pour preferred if possible.

---

**After minimum concrete cure time, hangers can be removed. Loosen the ‘T’ knob, push down on the rod, turn the rod through 90˚ and pull rod up to remove.**

Complete other third party equipment installation inside the sump.
Ensure void is free of concrete to a depth of 90mm (120mm on a high water table installation).

NB:- Area must NOT be filled with concrete

Void between corbel and skirt to be filled with pea gravel or sand.

Test completed system.

Warning: Test the corbel at a 0.6m depth setting only or irreparable damage may occur.

Refit platform and fit cover
